

Please do not allow electric utility companies to use broadband over power lines. The distribution system is an open wire network. There is no shielding like cable TV. There is no method to keep the broadband signal within the electric power conductors. This would result in radio signals being broadcast over the entire radio spectrum blanketing entire communities. Emissions of this nature would be harmful to all other radio signals including ham radio. There is already enough broadband signal (noise) that comes off the electric distribution system.
